

Region XII Technology Lunch and Learn
Network security in a bring-your-own-device (BYOD) environment

November 16, 2011

Increasingly, students and staff are bringing their own computing devices to school. In some districts it's part of an official "bring-your-own-device" initiative; in others, it is used to augment a 1-1 initiative; and many times students and staff are simply using their personal computers, tablets and smart phones on their own. In all cases, the BYOD phenomenon presents new challenges to K12 network administrators. Attend this "Lunch and Learn" seminar to learn how to protect the security of your network and the privacy and safety of your students and staff in a BYOD environment.

Topics covered in this lunch and learn session include:

- How official BYOD programs can lower IT costs, increase student and staff satisfaction and contribute to 1:1 educational computing.
- How districts can maintain CIPA compliance and boundary control in the face of 3G Internet access and personal and external WiFi hotspots.
- How to design a security architecture that enables device-flexibility.
- How network administrators can enforce registration, control and differentiation of services by user, device and location.
